

BioCeres WP

Premix Instructions:

Dilution is greatly enhanced using a premix process.

To premix a solution for 1.5 to 3.0 lbs. of BioCeres WP per 100 gallons of water:

1. Pour the needed amount of BioCeres WP into a plastic container.
2. Slowly add clean water to the same container. Use 1 gallon of water for every 1.5 lbs of BioCeres WP.
3. Shake vigorously until the texture becomes creamy/silky (a mechanical mixer, i.e., cordless drill with mixing paddle, will save time during premix).
4. Fill spray tank halfway with clean water and add the premixed BioCeres WP solution.
5. Rinse premix container 3 times with clean water, add all rinsed water to the spray tank prior to application.
6. Completely fill spray tank with clean water up to 100 gallons.

Constant agitation in tank is required for ensuring uniformity of spray combination during application (an emulsifying agent can be added).

Use premix and spray combination within 24 hrs of water introduction.
